

USER PROMPT:: I need to create a personal portfolio website for my class. Before we start coding, can you help me brainstorm what sections I should include, what information I could put in each section, and some ideas for the overall design and color scheme? I want it to feel professional but still personal.

ChatGPT Response:

Absolutely. Before coding, I'd organize the portfolio around a few clear sections so it feels professional without looking like a résumé pasted onto a webpage.

Sections you could include

1. Home

This should be a simple introduction to the site. You could include your name, a short welcome message, and clickable cards that lead to the other sections. A card-based homepage would make the portfolio feel more interactive while keeping it organized.

2. About Me

This can introduce who you are beyond just your name. You could include your major/minor, academic interests, programming languages or technical skills, career interests, and a few personal interests. Keeping some hobbies here would make the portfolio feel more personal.

3. Experiences

This would be a good place for work, volunteering, research, leadership, or campus involvement. For each experience, you could include the organization/role, dates, a short description of what you did, and skills you developed.

4. Projects

Keep projects separate from general experiences so visitors can quickly see things you've actually created or worked on. Each project could have a title, short description, tools or programming languages used, what you learned, and potentially a GitHub link.

5. Interests & Involvement

This is where you can show more personality. You could include clubs, sports, tutoring, hobbies, or organizations you're involved with. This section helps the website feel like a personal portfolio rather than only an academic profile.

6. Contact

Keep this simple: your school/professional email and GitHub would probably be enough for a student portfolio.

Overall design idea

I think a **card-based design** would work especially well. Your homepage could have your name and introduction at the top, followed by large cards such as:

Akshaya's Portfolio

Welcome to my personal portfolio...

Clicking a card could open that section rather than putting everything on one very long homepage.

Color scheme

For something professional but still warm and personal, I'd avoid the typical dark-blue corporate portfolio. A **sage green + cream + beige** palette could work really nicely:

- **Dark sage:** #7C8974 — navigation, buttons, accents
- **Light sage:** #A9BD9A — cards and highlights
- **Beige:** #D8D0C1 — secondary cards/backgrounds
- **Cream:** #FBF7EE — main background
- **Dark gray-green:** #3F463B — text

That combination would give the site a softer personality while still looking appropriate for an academic/professional portfolio.

For interactivity, the Experiences, Projects, and Interests sections could also use **expandable cards**: visitors see the title first, click it, and then the description expands underneath. That would keep longer information from making the site feel cluttered.

USER PROMPT::

im trying to make it into one index.html file. please make it into file where eveyrhting is

Yep — if you want **everything in one index.html file**, you can put the CSS inside `<style>` and JavaScript inside `<script>`. You only need **one file**.

Create `index.html` in VS Code and paste this entire thing:

```
<!DOCTYPE html>
<html lang="en">

<head>
  <meta charset="UTF-8">
  <meta name="viewport" content="width=device-width, initial-scale=1.0">

  <title>Akshaya's Portfolio</title>

  <!-- CSS is inside the HTML file -->
  <style>

    body {
      font-family: Arial, sans-serif;
      margin: 0;
      background-color: #f5f5f5;
      color: #222;
    }

    /* NAVIGATION BAR */

    nav {
      display: flex;
      justify-content: space-between;
      align-items: center;
      padding: 20px 10%;
      background-color: white;
```

```
}
```

```
nav ul {  
  display: flex;  
  list-style: none;  
  gap: 25px;  
}
```

```
nav a {  
  text-decoration: none;  
  color: #222;  
}
```

```
nav a:hover {  
  text-decoration: underline;  
}
```

```
/* GENERAL SECTIONS */
```

```
section {  
  padding: 70px 10%;  
}
```

```
/* HOME SECTION */
```

```
#home {  
  min-height: 60vh;  
  display: flex;  
  flex-direction: column;  
  justify-content: center;  
}
```

```
#home h1 {  
  font-size: 48px;  
  margin-bottom: 10px;  
}
```

```
#home p {  
  font-size: 20px;  
  max-width: 600px;  
}
```

```
/* PROJECT CARDS */
```

```
.project-card {  
  background-color: white;  
  padding: 25px;  
  margin: 20px 0;  
  border-radius: 10px;  
}
```

```
/* FOOTER */
```

```
footer {  
  text-align: center;  
  padding: 25px;  
  background-color: white;  
}
```

```
/* RESPONSIVE DESIGN */
```

```
@media (max-width: 700px) {
```

```
  nav {  
    flex-direction: column;  
  }
```

```
  nav ul {  
    padding: 0;  
  }
```

```
  #home h1 {  
    font-size: 36px;  
  }  
}
```

```
</style>
```

```
</head>
```

```
<body>
```

Learning new skills

</section>

<!-- PROJECTS -->

<section id="projects">

<h2>My Projects</h2>

<div class="project-card">

<h3>Personal Portfolio Website</h3>

<p>

My first 15-113 project is this personal portfolio website. I am using HTML and CSS to build it.

</p>

</div>

<div class="project-card">

<h3>Future Project</h3>

<p>

More projects will be added here throughout the semester.

</p>

</div>

```
</section>
```

```
<!-- CONTACT -->
```

```
<section id="contact">
```

```
  <h2>Contact Me</h2>
```

```
  <p>
```

```
    Email:
```

```
    <a href="mailto:akv62@pitt.edu">
```

```
      akv62@pitt.edu
```

```
    </a>
```

```
  </p>
```

```
  <p>
```

```
    GitHub:
```

```
    <a href="#">My GitHub</a>
```

```
  </p>
```

```
</section>
```

```
<!-- FOOTER -->
```

```
<footer>
```

```
  <p>Created for 15-113</p>
```

```
</footer>
```

```
<!-- JAVASCRIPT GOES HERE LATER -->
```

```
<script>
```

```
  // JavaScript functionality can be added here later.
```

```
  // Planned feature:
```

```
  // Add a dark mode button or another interactive feature.
```

```
</script>
```

```
</body>
```

```
</html>
```

How the one-file setup works

You now have **all three parts** inside **index.html**:

```
index.html
├── <style>
│   CSS
│   </style>
├── <body>
│   HTML
│   </body>
└── <script>
    JavaScript
    </script>
```

So in VS Code, your folder can literally just be:

```
my-portfolio/
└── index.html
```

Then right-click **index.html** → **Open with Live Server** if you have the Live Server extension, or simply open the file in your browser.

Also, since this is for your class and you're using AI-generated code, keep the AI-use comments/log required by your assignment and make sure you understand the pieces you submit.

USER PROMPT:

how do i push the changes i did on vs code into my github repository

Chat Reponse:

Oh, if you have **GitHub Desktop**, that's even easier — you don't need Command Prompt at all.

Assuming your repository is already opened in GitHub Desktop:

1. **Save your changes in VS Code first** with `Ctrl + S`.
2. Open **GitHub Desktop**.
3. At the top-left, make sure **Current repository** is your portfolio repository.
4. On the left side, you should see your changed `index.html` under **Changes**.
5. At the bottom-left, find the **Summary** box and type something like:
`Updated portfolio design`
6. Click **Commit to main**.
7. After it commits, click **Push origin** at the top.

That's it. Your new `index.html` is now pushed to GitHub.

Your workflow from now on is basically:

Edit in VS Code → Save → GitHub Desktop → Commit to main → Push origin

If you send me a **screenshot of what your GitHub Desktop currently looks like**, I can tell you exactly what to click next.

USER PROMPT:: for the projects page, the text just comes in one big blob code it where it has like cards of its own and a dropdown when i press on the title and then seperate it to one blob should be

Chat response:

```
function toggleExperience(experienceId) {  
  
    const experience =  
        document.getElementById(experienceId);  
  
    experience.classList.toggle("active");  
  
}
```
